Disclaimer:

The views expressed in this report are those of the authors alone and do not necessarily represent the opinions of the investigators participating in the survey, nor the view or policy of the Ministry of Health.

ACKNOWLEDGEMENT

The authors would like to thank the Director-General of Health Malaysia for his permission to publish this report. Appreciation to the Deputy Director-General of Health (Research and Technical Support) and the Director of the Institute for Public Health, for their support and technical advice throughout the various stages of the survey.

The National Health and Morbidity Survey 2014: Malaysian Adult Nutrition Survey, was accomplished with budget support from the Ministry of Health Malaysia and technical advice from the Advisory Panel and Steering Committee. The authors would like to express our sincere thanks to them.

The authors thank all the State Health Directors and State Liaison Officers who have been instrumental in mobilising resources during the data collection phase. Gratitude to all concerned who have assisted in the implementation of the survey, from the field supervisors, nutritionists, temporary staff and drivers, without whom the survey would not have been a success.

Last but not least, sincere appreciation is extended to all respondents who had participated and contributed their time and information to the survey, without whom there would not be any findings to report.

TOPIC 1

FOOD SECURITY STATUS

1. FOOD SECURITY STATUS

Contributors to this section: Zalilah Mohd Shariff, Chong Zhuo Lin, Rusidah Selamat, Ahmad Ali Zainuddin, Mohd Wan Azdie Mohamad Abu Bakar.

1.1 Findings

The Malaysian Adults Nutrition Survey measured food security at household, adult and child levels using six items which were adapted from the USDA 18-item Household Food Security Survey Module. Valid responses to each item were 'never', 'only one or two months', 'several months, but not every month', and 'almost every month'. Respondents who answered 'never' to an item were considered as having food security in that domain while those with other responses were considered as experiencing food insecurity.

In general, the proportions of respondents from East Malaysia and rural areas reporting food insecurity at household, adult or child level were significantly higher than those from Peninsular Malaysia and urban areas, respectively.

The prevalence of household food insecurity in terms of inadequate quantity of purchased foods were 39.24% (95% CI: 34.52-44.18) in East Malaysia versus 21.13% (95 % CI: 18.42-24.13) in Peninsular Malaysia, and 33.50% (95% CI: 29.90-37.30) in rural areas versus 21.19% (95% CI: 18.18-24.55) in urban areas (**Table 1.1**). The prevalence of respondents reporting purchased foods lacked variety were higher in East Malaysia (40.77%; 95% CI: 35.76-45.98) and rural areas (33.59%; 95% CI: 29.99-37.38) than in Peninsular Malaysia (21.42%; 95 % CI: 18.65-24.49), and urban areas (21.97%; 95% CI: 18.85-25.44) (**Table 1.2**).

The prevalence of adult food insecurity in relation to adults having reduced meal size were 31.84% (95% CI: 27.33-36.72) in East Malaysia versus 19.18% (95 % CI: 16.68-21.95) in Peninsular Malaysia, and 28.49% (95% CI: 25.09-32.15) in rural area versus 18.93% (95% CI: 16.16-22.04) in urban area (Table 1.3). The prevalence of adults skipping main meals were 23.29% (95% CI: 19.20-27.94) in East Malaysia versus 13.00% (95 % CI: 10.85-15.51) in Peninsular Malaysia, and 21.02% (95% CI: 17.71-24.76) in rural areas versus 12.61% (95% CI: 10.30-15.35) in urban areas (**Table 1.4**).

The prevalence of households experiencing child food insecurity in terms of reliance on limited number of cheap food to feed children were 39.58% (95% CI: 34.45-44.96) in East Malaysia versus 19.43% (95 % CI: 16.71-22.47) in Peninsular Malaysia, and 31.31% (95% CI: 27.61-35.27) in rural areas versus 20.11% (95% CI: 17.05-23.56) in urban areas (**Table 1.5**). The prevalence of respondents reporting inability to feed children with variety of foods were higher in East Malaysia (36.75%; 95% CI: 31.63-42.18) and rural areas (29.81%; 95% CI: 26.03-33.90) than in Peninsular Malaysia (16.53%; 95 % CI: 14.01-19.39) and urban areas (16.57%; 95% CI: 13.77-19.81) (**Table 1.6**).

1.2 Implications

Food insecurity has adverse effects on health and quality of life. Food insecure individuals are at risk of having inadequate food intake and poor diet quality. These conditions could compromise intake of energy and nutrients, particularly vitamins and minerals. The subsequent low blood nutrient levels, if prolonged, could lead to micronutrient deficiency. Children living in food insecure households have increased risk of stunting and underweight, poor cognitive development that could adversely affect academic performance, and psychological and social problems. In adults, food insecurity is associated with increased risk of overweight and obesity, chronic diseases and poor mental health. Food insecure individuals with chronic diseases may also have difficulties to follow the prescribed diets by medical and health professionals as healthy foods may be relatively expensive.

1.3 Conclusion

Food insecurity occurs at household, adult and child levels in Malaysia. At each level, the different dimensions of food insecurity assessed are consistently associated with similar demographic (zone, strata and ethnicity) and socioeconomic (education, work status and income) factors. Food insecurity is more prevalent in East Malaysia, rural areas, Bumiputra Sarawak as well as individuals with low education and income and working in non government sectors. As food insecurity is interrelated with socioeconomic status, the differences in prevalence of food insecurity by zone, strata and ethnicity could well reflect the socioeconomic differentials (ie income, education and work status) of individuals and households in Peninsular Malaysia – East Malaysia, urban-rural areas and of various ethnic groups.

1.4 Recommendations

Several strategies are recommended to prevent food insecurity or reduce the severity of food insecurity. Lack of education, low wages, job insecurity, un- and underemployment and poor living conditions are important underlying causes of food insecurity. These factors should be addressed through programs and policies that could increase economic security and subsequently food security. In addition, life management skills are essential for individuals to cope with the rising standard of living. Nutrition and financial management education are among the life skills that should be made available and accessible to individuals, particularly those who are at risk of food insecurity.

National food or financial assistance programs play an important role in alleviating food insecurity or reducing its severity. The coverage of such programs should be extended to food insecure individuals or households who are not necessarily living in poverty but are experiencing financial constraints. It has also been shown that promoting charity food based assistance programs could also benefit food insecure individuals and households.

Finally, food security should be high on the development agenda. It is important to have comprehensive policies and multisectoral collaborative efforts to promote food security in Malaysia. For example, policies to increase agricultural production and food availability must be align with public health goals that aim to promote better health and nutrition of population. These policies should also address the multi-dimensions of food security (availability, access, utilization and stability) as increased food availability may not necessarily improve food access and utilization.

Definition of variables : Food security.

Variable Name	Variable in SPSS	Weight	Definition	SPSS Variable Definition
A201	a201_DICHO	Final_weight	The food that I bought just didn't sufficient and I did not have money to buy more	RECODE a201 (4=2) (1 thru 3=1) (ELSE=Copy) INTO a201_DICHO. VARIABLE LABELS a201_DICHO 'a201_DICHO'. EXECUTE.
A202	a201_DICHO	Final_weight	I couldn't afford to buy types of food which were necessary	RECODE a202 (4=2) (1 thru 3=1) (ELSE=Copy) INTO a202_DICHO. VARIABLE LABELS a202_DICHO 'a202_DICHO'. EXECUTE.
A203	a201_DICHO	Final_weight	In the past twelve month, how often did you or other adults family members REDUCE the size of meals because there was not enough money to buy food?	RECODE a203 (4=2) (1 thru 3=1) (ELSE=Copy) INTO a203_DICHO. VARIABLE LABELS a203_DICHO 'a203_DICHO'. EXECUTE.
A204	a201_DICHO	Final_weight	In the past twelve month, how often did you or other adults family members SKIP main meals because there was not enough money to buy food?	RECODE a204 (4=2) (1 thru 3=1) (ELSE=Copy) INTO a204_DICHO. VARIABLE LABELS a204_DICHO 'a204_DICHO'. EXECUTE.
A205	a201_DICHO	Final_weight	I rely only on the cheap and affordable foods to feed the children.	RECODE a205 (4=2) (1 thru 3=1) (ELSE=Copy) INTO a205_DICHO. VARIABLE LABELS a205_DICHO 'a205_DICHO'. EXECUTE.
A206	a201_DICHO	Final_weight	I could not afford to feed the children with various foods as I do not have enough money	RECODE a206 (4=2) (1 thru 3=1) (ELSE=Copy) INTO a206_DICHO. VARIABLE LABELS a206_DICHO 'a206_DICHO'. EXECUTE.

TOPIC 2

MEAL PATTERN

2. MEAL PATTERN

Contributors to this section: Yeo Pei Sien, Norhafizah Sahril, Ahmad Nazri Jai, Mohamad Aznuddin Abd Razak, Nazli Suhardi Ibrahim, Hamid Jan B. Jan Mohamed

2.1 Findings

This module comprises 17 questions of interest on the usual daily food intakes of the respondents.

2.1.1 Breakfast

Overall, 93.7% (95% CI: 92.4-94.8) reported to take breakfast. Among those who reported, 93.5% (95% CI: 91.9-94.8) were in Peninsular Malaysia and 92.1% (95% CI: 90.2-93.6) in East Malaysia. The proportion of adults in the urban (94.5%, 95% CI: 92.7-95.85) who reported to take breakfast was found to be higher than rural adults (92.1%, 95% CI: 90.2-93.6) (**Table 2.1a**).

About 54.4% (95% CI: 51.6-57.2) reported to take a breakfast at home, while 13.1% (95% CI: 11.2-15.2) at stall and 12.2% (95% CI: 10.4-14.2) at office. Of those who reported to take breakfast at home, the proportion was slightly higher in rural areas [65.1% (95% CI: 62.0-68.5)] compared to urban area [49.7% (95% CI: 46.0-53.4)]. By region, significantly more adults in East Malaysia [70.4%, 95% CI: 66.9-73.8] reported to take breakfast at home compared to those in Peninsular Malaysia [50.0%, 95% CI: 46.6-53.4] (**Table 2.2a**).

Results showed that 50.7% (95% CI: 47.8-53.6) of adults reported that their source of breakfast were home prepared (**Table 2.6a**), 24.9% (95% CI: 22.4-27.6) obtained from stall (**Table 2.6b**) while 11.8% (95% CI: 10.2-13.6) from cafeteria (**Table 2.6a**) and 10.1% (95% CI: 8.3-12.1) from restaurant (**Table 2.6b**). Of those who reported as home prepared, the proportion was higher in rural areas at 61.8% (95% CI: 58.4-65.1) compared to urban area at 46.0% (95% CI: 42.2-49.8). And by region, significantly more adults in East Malaysia [70.3% (95% CI: 66.6-73.6)] reported that their source of breakfast were home prepared compared to those in Peninsular Malaysia [45.4% (95% CI: 41.9-48.9)] (**Table 2.6a**). However, for those who obtained food from stall, significantly more adults in Peninsular Malaysia (28.5%, 95% CI: 25.4-31.9) compared to East Malaysia [11.7% (95% CI: 9.6-14.0)] (**Table 2.6b**).

About 44.0% (95% CI: 41.4-46.7) reported to have breakfast with their family, while 28.3% (95% CI: 25.7-31.0) eat alone (**Table 2.10a**) and 27.5% (95% CI: 24.9-30.2) with friends (**Table 2.10b**). Among those who reported to take breakfast with their family, 58.3% (95% CI: 54.4-62.1) were from East Malaysia and 40.1% (95% CI: 37.0-43.3) were from Peninsular Malaysia. There was a higher proportion of rural population (54.7%, 95% CI: 51.1-58.3) taking breakfast with their family as compared to urban population (39.4%, 95% CI: 36.0-42.9) (**Table 2.10a**). Of those who reported taking breakfast alone and with friends, there was a higher proportion of urban (30.5%, 95% CI: 27.1-34.2; 29.7%, 95% CI: 26.2-33.5) compared to rural (23.0%, 95% CI: 19.9-26.4; 22.2%, 95% CI: 19.5-25.3) (**Table 2.10a & Table 2.10b**).

2.1.2 Lunch

Overall, 94.5% (95% CI: 93.3-95.4) of adults were reported to take lunch. Among those who took lunch, the prevalence were significantly higher among adults in East Malaysia [97.1% (95% CI: 95.8-98.1)] compared to Peninsular Malaysia [93.8% (95% CI: 92.3-95.0)] (**Table 2.1a**).

More than half of the Malaysian adults [52.7% (95% CI: 49.8-55.5)] had their lunch at home and the prevalence were significantly higher among those who resided in East Malaysia [61.2% (95% CI: 57.5-64.8)] and rural areas [70.1% (95% CI: 66.7-73.2)] (**Table 2.3a**). The other venues where lunch were consumed most, were at restaurant [14.4% (95% CI: 12.5-16.5)] and office [12.1% (95% CI: 10.5-14.0)]. Adults who resided in Peninsular Malaysia [16.1% (95% CI: 13.8-18.8)] and urban areas [18.7% (95% CI: 16.1-21.6)] were reported to have higher prevalence of taking lunch at the restaurant (**Table 2.3b**). Meanwhile, adults who resided in East Malaysia 14.0% (95% CI: 11.2-17.4) and urban areas [14.0% (95% CI: 11.9-16.5)] were found had higher prevalence of taking lunch at the office (**Table 2.3a**).

The results showed that 59.8% (95% CI: 52.1-57.5) of adults reported that their source of lunch were home prepared (**Table 2.7a**), 17.5% (95% CI: 15.4-19.9) obtained from restaurant (**Table 2.7b**), 14.2% (95% CI: 12.2-16.5) from stall (**Table 2.7b**), while 11.3% (95% CI: 9.8-13.0) from the cafeteria (**Table 2.7a**). There were significantly higher prevalence of adults in East Malaysia [71.7% (95% CI: 68.0-75.1)] and in rural areas [74.3% (95% CI: 70.8-77.5)] had home prepared lunch (**Table 2.7a**). Of those who consumed food from restaurant, the higher prevalence were among adults in Peninsular Malaysia [19.5% (95% CI: 16.8-22.4)] and urban areas [22.6% (95% CI: 19.6-25.8)] (**Table 2.7b**). Significantly more adults in Peninsular Malaysia [16.4% (95% CI: 13.9-19.3)] consumed lunch at stall (**Table 2.7b**).

The majority of Malaysian adults had their lunch with their family [44.7% (95% CI: 42.0-47.5)] (**Table 2.11a**), followed by eating with friends [34.3% (95% CI: 31.8-36.9)] (**Table 2.11b**) and eating alone [20.8% (95% CI: 18.7-23.0)] (**Table 2.11a**). Among those who had lunch with family, the higher prevalence were significantly reported among adults that resided in East Malaysia [51.9% (95% CI: 47.8-56.0)] and rural areas [58.2% (95% CI: 54.4-61.9)] (**Table 2.11a**). Meanwhile, significant higher proportion of adults in Peninsular Malaysia [35.5% (95% CI: 32.5-38.6)] and urban [39.8% (95% CI: 36.5-43.1)] had lunch with friends (**Table 2.11b**). There were no significant differences by zone and strata for those who ate their lunch alone.

2.1.3 Dinner

Dinner consumption indicated that 96.4% (95% CI: 95.4-97.1) of respondents consumed dinner (**Table 2.1b**). The percentage of those who took dinner at home was significantly higher among the respondents in East Malaysia [93.7% (95% CI: 91.8-95.2)] and rural areas [92.1% (95% CI: 90.1-93.8)] (**Table 2.4a**). Meanwhile, significantly more adults in Peninsular Malaysia [6.9% (95% CI: 5.5-8.5)] and urban areas [7.3% (95% CI: 5.8-9.1)] had dinner at a restaurant (**Table 2.4b**). In general, 83.2% (95% CI: 81.0-85.2) of adults reported that their dinner was home prepared with significantly more in East Malaysia [93.0% (95% CI: 91.1-94.5)] and rural areas [89.8% (95% CI: 87.4-91.7)] (**Table 2.8a**). While, 9.3% (95% CI: 7.6-11.2) and 7.5% (95% CI: 6.0-9.3) of adults in Peninsular Malaysia reported that their sources of dinner were obtained from restaurant and stall, respectively (**Table 2.8b**). About 79.7% (95% CI: 77.2-82.1) Malaysian adults had their dinner with the family (**Table 2.12a**). The results showed that higher proportion of adults in

East Malaysia [83.9 (95% CI: 80.8-86.7)] and rural areas [82.0% (95% CI: 78.7-84.9)] had their dinner with their family (**Table 2.12a**). As for other meal companion for dinner, there were no significant differences among Malaysian adults.

2.1.4 Heavy meal after dinner

A total of 31.9% (95% CI: 29.4-34.5) of adults had the habit of having heavy meal after dinner. Among those who reported, 34.0% (95% CI: 30.9-37.2) were in Peninsular Malaysia and 24.2% (95% CI: 21.2-27.5) were in East Malaysia. Meanwhile, the proportion of adults in the urban [33.8% (95% CI: 30.4-37.3)] who had heavy meal after dinner was also found to be higher than rural adults [(27.7% (95% CI: 24.7-30.9)] (**Table 2.1b**).

About 56.6% (95% CI: 52.1-61.0) reported that they had heavy meal after dinner at home (**Table 2.5a**), while 21.7% (95% CI: 17.9-26.1) at restaurant (**Table 2.5b**) and 16.5% (95% CI: 13.4-20.2) at stall (**Table 2.5c**). Of those who had their heavy meal after dinner at home, the proportion was slightly higher in rural areas [66.5% (95% CI: 59.9-72.5)] compared to urban areas [53.0% (95% CI: 47.4-58.5)] (**Table 2.5a**). And by region, significantly more adults in East Malaysia [74.2% (95% CI: 67.6-79.8)] reported to have their heavy meal after dinner at home compared to those in Peninsular Malaysia [53.2% (95% CI: 48.0 – 58.3)] (**Table 2.5a**).

The findings revealed that 34.2% (95% CI: 2.1-30.2) of adults reported that their heavy meal after dinner were home prepared (**Table 2.9a**), 31.3% (95% CI: 2.0-27.5) of them obtained from stall (**Table 2.9b**) while 27.5% (95% CI: 2.3-23.2) from restaurant (**Table 2.9b**). Of those who reported as home prepared, the proportion was significantly higher in rural areas at 47.6% (95% CI: 41.7-53.6) compared to urban area at [29.3% (95% CI: 24.4-34.8)] (**Table 2.9a**). Significantly more adults in East Malaysia (56.5% (95% CI: 48.0-64.6)] reported that their source of heavy meal after dinner were home prepared compared to those in Peninsular Malaysia [29.9% (95% CI: 25.5-34.8)] (**Table 2.9a**). However, for those who obtained food from stall, significantly more adults in Peninsular Malaysia [34.1% (95% CI: 29.6-38.9)] compared to East Malaysia [(16.8% (95% CI: 11.3-24.1)] (**Table 2.9b**).

Overall, 44.5% (95% CI: 40.0-49.1) reported that they had heavy meal after dinner with their family (**Table 2.10a**), while 28.7% (95% CI: 24.8-32.9) ate with friends (**Table 2.10b**) and 26.6% (95% CI: 23.0-30.7) were alone (**Table 2.10a**). Among those who reported to take heavy meal after dinner with their family, 45.2% (95% CI: 40.0-50.5) were in Peninsular Malaysia and 40.6% (95% CI: 34.1-47.4) were in East Malaysia. There also was a higher proportion of urban population (45.1%, 95% CI: 39.5 – 50.9) took heavy meal after dinner with their family as compared to rural population [42.7% (95% CI: 36.3-42.3)] (**Table 2.10a**).

2.2 Implications

High prevalence of breakfast, lunch and dinner intake among Malaysian adults was reported both in Peninsular Malaysia and East Malaysia, regardless of strata. All these 3 meals were consumed by more than 90% adults in Malaysia at each occasion. This is a good meal consumption practice as it provides energy and nutrients consistently throughout the day.

However, almost half of Malaysian adults obtain food outside home. The prevalence is higher among those who live in Peninsular Malaysia and in urban areas. This could be due to limited time to prepare meals at home and also due to more time spent at workplace compared to home. Furthermore, abundance of eateries in the urban areas may attract this group to consume meals outside home. Hence, it is very important that this group of adults is given access to healthy meals from cafeterias, stalls and restaurants. Lack of such choices may lead to consumption of unhealthy meals which may lead to the development of obesity and non-communicable diseases.

High proportion of urban adults reported to consume meals alone or with friends. In contrast, high proportion of rural adults consumes meals with family members. The polarization of meal companions between strata should be addressed. Family members and peers play an important role in determining meal intake. Family members should observe meal time as not only an event to consume food but also a time to socialize and strengthen the family bonding. Peers should support each other in motivating to consume healthy meals and not over indulging themselves with high fat and large amount of foods. It is important that each adult equipped with adequate knowledge on healthy food choice as they could use this knowledge on themselves and also to educate and guide other around them.

This survey reported high prevalence of consumption of heavy meal after dinner. As above, it is consistently reported high among adults in Peninsular Malaysia and urban areas. The additional calorie obtained from the heavy meal after dinner may lead to excess energy intake and may lead to chronic disease development. This unhealthy eating behaviour should be addressed to educate adults as not to engage in such eating pattern. Adults should have the knowledge and motivation to replace heavy meals after dinner with light and healthy snacks.

2.3 Conclusion

The findings of this survey showed that there is still a need to promote healthy meal pattern among adults in Malaysia in relation to healthy food choices at home and outside home, as well as avoiding heavy meal after dinner consumption.

2.4 Recommendations

From the findings of this survey, it is recommended that nutrition education programme to be focused on addressing the high prevalence of taking heavy meal after dinner and the practice of eating out from home. Eateries should provide healthy choices in their menu and ensure the cleanliness of food served because almost half of the Malaysian adults obtained food outside home. A friendly and comprehensive nutrition education programme should be provided to create awareness among adults and food handlers for the prevention of non-communicable disease.

Definition of variables: Habits in relation to food consumption.

Variable Name	Variable in SPSS	Weight	Definition	SPSS Variable Definition

TOPIC 3

FOOD INTAKE BY FOOD GROUP

3. FOOD INTAKE BY FOOD GROUP

Contributors to this section: Nur Shahida Abdul Aziz, Norzawati Yoep, Faizah Pawai, Safiah Md. Yusof, Riyanti Saari.

3.1 Findings

3.1.1 Frequency of confectionery intake

The intake for confectionery was carried out on all respondents aged 18 years and above using an interview questionnaire. A total of 2169 subjects responded to the confectionery intake questionnaire, based on how many days they took confectionery during the past one week. The mean frequency of intake for confectionery among adults of 18 years and above in this survey was 2.91 days per week (95% CI: 2.80 – 3.02) (**Table 3.1**).

There was a no significant difference in intake between Peninsular Malaysian and East Malaysia, where adults in Peninsular Malaysia had a lower mean frequency of intake [2.89 days per week (95% CI: 2.76 – 3.03)] compared to East Malaysia [2.95 days per week (95% CI: 2.78 – 3.12)] (**Table 3.1**).

The mean frequency of intake in the rural areas was 3.08 days per week (95% CI: 2.90 – 3.26) while in urban areas it was 2.82 days per week (95% CI: 2.68 – 2.97), and the difference was not statistically significant (**Table 3.1**).

3.1.2 Mean serving size of confectionery intake

Subjects in this survey who took confectionery during the previous week were asked about the number of servings of confectionery they took in each day. The mean serving size of confectionery among adults of 18 years and above in this survey was 1.79 (95% CI: 1.72 – 1.86) servings per day (**Table 3.2**).

There was a no significant difference between Peninsular Malaysian and East Malaysia, where adults in Peninsular Malaysia had a mean serving size of 1.74 (95% CI: 1.66 – 1.83) and adults in East Malaysia had a mean serving size of 1.93 (95% CI: 1.83 – 2.03) of confectionery intake (**Table 3.2**).

The mean serving in the rural areas was 1.82 (95% CI: 1.73 – 1.90) while in urban areas was 1.77 (95% CI: 1.68 – 1.87), and the difference was not statistically significant (**Table 3.2**).

3.1.3 Frequency of fruits intake

The intake for fruit was asked to all respondents of 18 years old and above. Fruits included 100 percent pure fruit juice. A total of 2477 subjects responded to the fruit intake questionnaire, based on how many days they took fruits during the past one week. The mean frequency of intake for fruits among adults of 18 years and above in this survey was 3.70 days per week (95% CI: 3.58 – 3.81) (**Table 3.3**).

There was a significant difference in fruits intake between Peninsular Malaysia and East Malaysia, where adults in Peninsular Malaysia had a higher mean frequency of fruit intake [3.79 days per week (95% CI: 3.65 – 3.93)] compared to East Malaysia [3.28 days per week (95% CI: 3.14 – 3.43)] (**Table 3.3**).

The mean was slightly higher in the urban areas at 3.85 days per week (95% CI: 3.69 – 4.00) compared to rural areas at 3.33 days per week (95% CI: 3.19 – 3.46), and the difference was statistically significant (**Table 3.3**).

3.1.4 Mean serving size of fruits intake

Subjects in this survey who took fruits during the previous week were asked about the number of servings of fruits they took in each day. The mean serving size of fruits among adults of 18 years and above in this survey was 1.40 (95% CI: 1.35 – 1.44) servings per day (**Table 3.4**).

There was a significant difference between Peninsular Malaysia and East Malaysia. Mean serving of fruits for adults in Peninsular Malaysia [1.33 (95% CI: 1.28 – 1.38)] was lower than East Malaysia [1.66 (95% CI: 1.56 – 1.76)] (**Table 3.4**).

Mean serving size of fruits intake between urban and rural areas showed a significant difference, where mean serving size of fruits among adults in urban areas [1.36 (95% CI: 1.30 – 1.41)] was lower compared to adults in rural areas [1.49 (95% CI: 1.42 – 1.56)] (**Table 3.4**).

3.1.5 Adequacy of fruits intake

In this survey, respondents were asked how many days in a week during the previous week they took fruits as well as the number of servings each time. Adequate frequency of intake means they had been eating fruits for at least seven days during the previous week. Adequate number of servings of fruits is two per day (**Table 3.3**).

For all Malaysians the intake of fruits is below the frequency that has been recommended in the Malaysian Dietary Guidelines 2010 (3.7 versus 7.0 days per week). The frequency for Peninsular Malaysia was significantly higher compared to East Malaysia (3.79 versus 3.28 days per week). However both intakes were below the recommended frequency. Urban subjects took fruits significantly more frequently than rural subjects (3.85 versus 3.33 days per week). However both intakes were below the recommended frequency (**Table 3.3**).

Malaysian adults took less serving of fruits per day than recommended in the Malaysia Dietary Guidelines 2010 (1.40 versus 2.00). Adults in Peninsular Malaysia and in urban areas had lower mean serving size of fruits compared to adults in East Malaysia and in rural areas. However, the mean serving sizes for all strata were below the recommended level (**Table 3.4**).

3.1.6 Frequency of vegetables intake

The intake for vegetables was asked to all respondents of 18 years old and above. A total of 2888 subjects responded to the vegetable intake questionnaire, based on how many days they took vegetables during the past one week. The mean frequency of intake for vegetables among adults of 18 years and above in this survey was 5.90 days per week (95% CI: 5.82– 5.99) (**Table 3.5**).

There was no significant difference in intake of vegetables between adults in Peninsular Malaysia and in East Malaysia, where adults in Peninsular Malaysia had a mean frequency of 5.88 days per week (95% CI: 5.78 – 5.99) whilst adults in East Malaysia had a mean frequency of 5.98 days per week (95% CI: 5.84 – 6.11) (**Table 3.5**).

The mean frequency of intake for vegetables in urban areas was 6.00 days per week (95% CI: 5.90 – 6.11), which was slightly higher compared to intake in rural areas at 5.68 days per week (95% CI: 5.55 – 5.82), and the difference was statistically significant (**Table 3.5**).

3.1.7 Mean serving size of vegetables intake

Subjects in this survey who took vegetables during the previous week were asked about the number of servings of vegetables they took in each day. The mean serving size of vegetables among adults of 18 years and above in this survey was 1.51 (95% CI: 1.45 – 1.57) servings per day (**Table 3.6**).

The mean serving size for vegetables was lower in Peninsular Malaysia at 1.43 (95% CI: 1.37 – 1.50) compared to East Malaysia at 1.80 (95% CI: 1.66 – 1.93), and the difference was statistically significant (**Table 3.6**).

There was no significant difference in the mean serving size between adults in urban and rural areas. The mean serving size for vegetables in urban and rural areas were 1.48 (95% CI: 1.41 – 1.55) and 1.59 (95% CI: 1.49 – 1.68) respectively (**Table 3.6**).

3.1.8 Adequacy of vegetables intake

In this survey, respondents were asked how many days in a week during the previous week they took vegetables as well as the number of servings each day. According to the recommendations in the Malaysian Dietary Guidelines 2010, adequate frequency of intake of vegetables means they had vegetables on at least seven days during the previous week. Adequate number of servings of vegetables is three serving per day.

For all Malaysians, the intake of vegetables is below the recommended frequency (5.9 versus 7.0 days per week). The frequency of intake for Peninsular Malaysia was lower compared to East Malaysia (5.88 versus 5.98 days per week), but there was no significant difference between them. However both intakes were below the recommended frequency. Urban subjects took vegetables significantly more frequently than rural subjects (6.00 versus 5.68 days per week). However both intakes were below the recommended frequency (**Table 3.5**).

The mean serving size of vegetables among Malaysian adults was lower than the recommended level (1.51 versus 3.00). The mean serving size in East Malaysia was higher compared to Peninsular Malaysia but both were below the recommendations. Mean serving size of vegetables in urban and rural areas was also below the recommended level (**Table 3.6**).

3.1.9 Frequency of water intake

The questions on intake for water were asked to all respondents of 18 years old and above. A total of 2979 subjects responded to the water intake questionnaire, based on how many days they took water during the past one week. The mean frequency of intake for water among adults of 18 years and above in this survey was 6.94 days per week (95% CI: 6.91 – 6.96) (**Table 3.7**).

The water intake between adults in Peninsular Malaysia and adults in East Malaysia showed no significant difference. The mean frequency of water intake was 6.93 days per week (95% CI: 6.90 – 6.96) in Peninsular Malaysia and 6.95 days per week (95% CI: 6.92 – 6.99) in East Malaysia (**Table 3.7**).

There was no significant difference between urban and rural areas, where adults in urban areas had water on 6.95 days per week (95% CI: 6.92 – 6.97) while adults in rural areas had water on 6.91 days per week (95% CI: 6.88 – 6.95) (**Table 3.7**).

3.1.10 Mean serving size of water intake

Subjects in this survey who took water during the previous week were asked about the number of servings of water they took in each day. The mean serving size of water among adults of 18 years and above in this survey was 7.01 (95% CI: 6.72 – 7.29) servings per day (**Table 3.8**).

Mean serving size of water intake in Peninsular Malaysia and East Malaysia showed no significant difference. In Peninsular Malaysia, the mean serving size of water intake was 6.86 servings (95% CI: 6.51 – 7.20) whereas in East Malaysia was 7.56 (95% CI: 7.16 – 7.97) (**Table 3.8**).

The mean serving size was higher in the urban areas at 7.30 (95% CI: 6.91 – 7.68) compared to rural areas at 6.35 (95% CI: 6.01 – 6.70), and the difference was statistically significant (**Table 3.8**).

3.1.11 Adequacy of water intake

In this survey, respondents were asked how many days in a week during the previous week they drank plain water as well as the number of servings in each day. Adequate intake of water means they had water on at least seven days during the previous week. Adequate number of servings of water is six to eight glasses per day.

The frequency of water intake among Malaysian adults was slightly lower than recommended in the Malaysian Dietary Guidelines 2010 (6.94 days versus 7.00 days). Frequency of water intake in Peninsular Malaysia, East Malaysia, urban and rural areas were slightly lower than recommended levels.

Mean serving size of water intake in a day among adults in Malaysia followed the Malaysian Dietary Guidelines. In Peninsular Malaysia and East Malaysia, they drank water daily as recommended in the guidelines. The mean serving size in urban areas was higher compared rural areas and both met the recommended levels.

3.2 Implications

3.2.1 Fruits and vegetables intake

Fruits and vegetables are rich sources of minerals and vitamins including potassium, fiber, folate (folic acid), and vitamin A, E, and C. These nutrients are vital for health, maintenance of the body and prevention of certain diseases.

Many epidemiological studies have shown a strong association between eating fruits and vegetables and they are protective against cancer. The latest report by the World Cancer Research Fund and the American Institute for Cancer Research has indicated that there is a possible decreased risk of certain types of cancer by eating fruits and vegetables¹. Non-starchy vegetables such as lettuce, green leafy vegetables, broccoli, Chinese cabbage, cabbage, garlic and onions probably protect against cancer of the mouth, pharynx, larynx, oesophagus, and stomach. Fruits also probably protect against lung cancer besides those cancers mentioned above. Tomatoes may help protect men against prostate cancer².

The Nurses' Health Study and Health Professionals follow-up study³ showed strong evidence that a diet rich in fruits and vegetables can lower the risk of heart disease and stroke. Eating 5 serving of fruits and vegetables per day can lower the risk of coronary heart diseases and stroke by 20 percent, compared to eating less than 3 serving per day^{4,5}.

Eating fruits and vegetables that are rich in potassium as part of an overall healthy diet may lower blood pressure, and may also reduce the risk of developing kidney stones and help decrease bone loss. Recent studies have shown that consumption of whole fruits, green leafy vegetables are associated with a lower risk of diabetes. Fruits and vegetables are also important for maintenance of gastrointestinal health. The indigestible fiber in fruits and vegetables reduce symptoms of irritable bowel syndrome⁶. Insoluble fiber may help prevent diverticulosis⁷. Eating fruits and vegetable can keep our eyes healthy and may help prevent cataract and macular degeneration⁸.

In this survey Malaysian adults on average do not consume enough fruits and vegetable in terms of the frequency and amount. This implies that certain proportions of the population do not benefit from the protective effects of fruits and vegetables against cancer, coronary heart disease, diabetes, high blood pressure, diverticulosis, constipation, cataract and macular degeneration. Promoting the intake of fruits and vegetables according to the recommendations for all Malaysians may help to reduce the increasing prevalence of non-communicable diseases, including type 2 diabetes, cardiovascular disease and cancer among Malaysian adults. This Malaysians will be able to maintain good health status and well being.

3.2.2 Water intake

Our body is composed of about 60 percent water. It is the principal chemical constituent of the human body. The functions of these bodily fluids include digestion, absorption, circulation, creation of saliva, transportation of nutrients, and maintenance of body temperature.

Water is therefore essential for maintenance of health. The following are benefits of adequate water intake:- water can help control calories by substituting it for higher calorie drinks. In a systematic review on the impact of energy intake and health status found that adults drinking sugar-sweetened beverages (SSBs) had a 7.8 percent higher total energy

intake than those who drank plain water⁹. Water helps to energize muscles. Muscle that do not have enough fluids do not function well that can affect performance, 'Water helps keep the skin looking good', dehydration makes our skin look dry and wrinkled, this can be improved by drinking more water, 'Water helps the kidneys to function efficiently. When our body is not getting enough fluids, our urine is concentrated and becomes dark yellow in color. This is because the kidneys trap extra fluid for other bodily functions. People who consistently drink too little, maybe at a higher risk for kidney stones, especially in warm climates such as Malaysia. Water helps to maintain normal bowel functions. If the body is well hydrated, the gastrointestinal tract flows well and this can prevent constipation.

In this survey, adult Malaysians drink enough water daily as recommended in the Malaysian Dietary Guidelines. This is a good habit that should be maintained for the well being of all Malaysians.

3.3 Conclusions

3.3.1 Fruits and vegetables

The findings of this survey showed that Malaysian adults do not meet the recommended intake of fruits and vegetables in terms of its amount and frequency. There were significant differences in the frequency of intake and the amount eaten between Peninsular Malaysia and East Malaysia, and between urban and rural adults.

3.3.2 Water

The findings of this survey showed that Malaysian adults meet the recommended intake of plain water in terms of its amount and frequency. There were no differences in intake between adults in Peninsular Malaysia and East Malaysia as well as between adults in urban and rural areas.

3.4 Recommendations

Knowledge on the health benefits of eating fruits and vegetables is an important factor to encourage Malaysians eating more fruits and vegetables daily as part of their healthy diet. This habit can be developed from childhood. Therefore, promotion and education on eating fruits and vegetables should be given to all Malaysians at all ages, from children, adolescents, and adults. Schools should have programs and activities to encourage children to eat fruits and vegetables, during recess and lunch times.

The cafeterias at workplace should offer fruits and vegetables as an essential part of their menu. These activities create awareness and provide easy access to fruits and vegetables. The "Durian Festival" appears to gain popularity among Malaysians. This activity should also expand to other local fruits such as rambutan, mangoesteen, jackfruit and cempedak. It will encourage children as well as adults to appreciate the local fruits.

Since Malaysian adults are drinking adequate amount of plain water daily, this healthy habit should be acknowledged and conveyed to the population. In order for Malaysians to continue this practice, the messages from the Malaysian Dietary Guideline "Drink six to eight glasses of plain water daily" and the messages on "How to achieve this" should be

part of a continuous education program to the population.

TOPIC 4

HABITS IN RELATION TO FOOD CONSUMPTION

4. HABITS IN RELATION TO FOOD CONSUMPTION

Contributors to this section: Yaw Siew Lian, Khairiyah Abdul Muttalib, Nurrul Ashikin Abdullah, Mohamad Fuad Mohamad Anuar, Hasmila Mat Hassan, Hamizatul Akmal Abd Hamid, Lim Kuang Hock.

4.1 Findings

This module comprises seven questions of interest on habits in relation to usual food intake of the respondents.

4.1.1 Consumption of plain water in relation to main meals

About 99.0% (95% CI: 98.5 – 99.3) reported drinking plain water either before, during or after meals while 1.0% (95% CI: 0.7 – 1.5) did not drink any water before, during or after meals (**Table 4.1**). Among those who reported consuming water either before, during or after meals, about 22.2% (95% CI: 19.9 – 24.6) reported consuming plain water within thirty minutes before meals (**Table 4.2**), 18.8% (95% CI: 16.6 – 21.3) during meals and 59.0% (95% CI: 56.6 - 61.4) after meals. Significantly less Bumiputera Sarawak adults (9.8%, 95% CI: 6.8 – 14.1) consumed plain water before meals compared to other ethnic groups (**Table 4.2**).

4.1.2 Consumption of fruits in relation to main meals

About 89.0% (95% CI: 87.2 – 90.7) reported eating fruits either within thirty minutes before meals (**Table 4.3**), during or after meals, while 11.0% (95% CI: 9.3 – 12.8) reported not consuming any fruits. Among those who reported eating fruits either within thirty minutes before meals, during or after meals, about 23.2% (95% CI: 21.2 – 25.3) reported they had eaten fruits within thirty minutes before meals, 4.9% (95% CI: 3.7 - 6.5) during meals and 72.0% (95% CI: 69.7 – 74.1) after meals (**Table 4.4**). The prevalence of adults who reported eating fruits within thirty minutes before meals was significantly higher (30.2%, 95% CI: 26.4 – 34.4) among those with tertiary education compared to those who had no formal education (16.2%, 95% CI: 10.1 – 25.0) and, those whose education level was at primary level (16.9%, 95% CI: 13.2 – 21.5) and also those whose education level was at secondary level only (20.9%, 95% CI: 18.5 – 23.7). Significantly more government/semi-government employees (35.5%, 95% CI: 29.4 – 42.1) consumed fruits before main meals compared to private employees (20.6%, 95% CI: 17.5 – 24.0) and, those who were self-employed (23.0%, 95% CI: 19.2 – 27.3) and adults who were not working (21.9%, 95% CI: 17.6 – 26.9) (**Table 4.4**).

4.1.3 Number of times food was chewed before swallowing

About 88.6% (95% CI: 85.2 – 91.3) reported on the number of times they had chewed their food before swallowing while 11.4% (95% CI: 8.7 – 14.8) did not know the number of times concerned (**Table 4.5**). Among those who knew the number of times they had chewed their food before swallowing, about 73.8% (95% CI: 70.9 - 76.5) reported they had chewed their food less than 20 times, 23.9% (95% CI: 21.4 - 26.5) had chewed 20-40 times and 2.3% (95% CI: 1.6 – 3.3) more than 40 times (**Table 4.6**). The prevalence of adults who chewed their food between twenty to forty times was significantly lower among 'Bumiputera Sarawak' adults (14.2%, 95% CI: 10.5 – 18.9) compared to Malays (26.0%, 95% CI: 22.8 – 29.5) (**Table 4.6**).

4.1.4 Use of straw when consuming carbonated drinks

About 80.8% (95% CI: 78.7 – 82.7) reported they had either used a straw or not used a straw when drinking carbonated beverages while 19.2% (95% CI: 17.3 – 21.3) had not consumed carbonated beverages at all (**Table 4.7**). Among the former group, about 28.0% (95% CI: 25.4 – 30.9) reported they had always used a straw, 20.4% (95% CI: 18.2 – 22.6) only used a straw sometimes and 51.6% (95% CI: 48.8 – 54.4) never at used a straw when drinking carbonated beverages (**Table 4.8**). Significantly less adults in Peninsular Malaysia (26.1%, 95% CI: 22.9 – 29.6) always use straw when consuming carbonated beverages compared to those in East Malaysia (34.4%, 95% CI: 30.5 – 38.5) (**Table 4.8**). Less adults aged 50-59 (18.8%, 95% CI: 14.3 – 24.3) always use straw when consuming carbonated beverages compared to those in the age group of 20-29 (34.8%, 95% CI: 29.8 – 40.1) and 30-39 (28.8%, 95% CI: 24.6 – 33.4). . Significantly less Bumiputera Sarawak adults (24.4%, 95% CI: 18.8 – 31.2) always use straw when consuming carbonated beverages compared to Bumiputera Sabah adults (39.0%, 95% CI: 32.1 – 46.4) (**Table 4.8**).

4.1.5 Mouth rinsing after consuming sugary food

About 62.5% (95% CI: 59.8 – 65.0) reported they had rinsed their mouth after taking sugary food while 37.5% (95% CI: 35.0 – 40.2) had not rinsed their mouth (**Table 4.9**). Significantly more males (44.5%, 95% CI: 40.7 – 48.3) than females (30.0%, 95% CI: 26.7 – 33.4) reported not rinsing their mouth after taking sugary food (**Table 4.9**). By age group, more adults in the youngest age group of 18-19 years (51.3%, 95% CI: 39.6 – 62.8) do not rinse their mouth after taking sugary food compared to older adults in the age group of 30-39 (35.5%, 95% CI: 31.8 – 39.4) and 50-59 years (31.1%, 95% CI: 26.4 – 36.2) (**Table 4.9**). The prevalence of adults of Chinese ethnicity (47.8%, 95% CI: 42.1 – 53.6) who do not rinse their mouth after taking sugary food was significantly higher compared to other ethnic groups; Malays (34.6%, 95% CI: 31.1 – 38.3), Indians (29.8%, 95% CI: 21.2 – 40.0) and 'Bumiputera Sarawak' (33.5%, 95% CI: 26.1 – 41.8) (**Table 4.9**). By marital status, significantly more adults who were never married (47.0%, 95% CI: 41.4 – 52.6) had not rinsed their mouth after taking sugary food compared to the other groups; married (34.2%, 95% CI: 31.7 – 36.8) and separated/divorced (26.4%, 95% CI: 18.9 – 35.5) adults. By employment status, more adults who were self-employed (40.1%, 95% CI: 35.9 – 44.5) reported not rinsing their mouth after taking sugary food compared to government/semi-government employees (25.8%, 95% CI: 20.7 – 31.6) (**Table 4.9**). Of those who had rinsed their mouth after taking sugary food, about 61.7% (95% CI: 58.6 – 64.8) reported they had always rinse their mouth after taking sugary food while 38.3% (95% CI: 35.2 – 41.4) had only sometimes rinsed their mouth after taking sugary food (**Table 4.10**). Significantly less adults with a monthly income below RM1500 (57.4%, 95% CI: 53.0 – 61.7) had always rinse their mouth after taking sugary food compared to those with those with a monthly income of more than RM3500 (68.1%, 95% CI: 62.4 – 73.4) (**Table 4.10**).

4.1.6 Brushing teeth before breakfast

About 95.6% (95% CI: 94.4 - 96.6) reported they had brushed their teeth before breakfast while 4.4% (95% CI: 3.4 – 5.6) had not (**Table 4.11**). Significantly more males (5.7%, 95% CI: 4.2 – 7.8) than females (2.9%, 95% CI: 2.1 - 4.0) reported not brushing their teeth before breakfast (**Table 4.11**). Of those who reported brushing their teeth before breakfast, about 94.7% (95% CI: 93.4 – 95.7) reported they had always brushed their teeth before breakfast and 5.3% (95% CI: 4.3 - 6.6) had only sometimes brushed their teeth before

breakfast (**Table 4.12**).

4.1.7 Brushing teeth after main meals

About 52.4% (95% CI: 49.4 – 55.4) reported they had brushed their teeth after the main meals while 47.6% (95% CI: 44.6 – 50.6) had not. By region, significantly more adults in East Malaysia (64.3%, 95% CI: 60.0 – 68.4) reported brushing their teeth after main meals compared to those in Peninsular Malaysia (49.1%, 95% CI: 45.5 – 52.8). More adults in the rural (59.0%, 95% CI: 55.0 – 63.0) reported brushing their teeth after main meals compared to urban adults (49.5%, 95% CI: 45.5 – 53.4). Significantly more females (57.4%, 95% CI: 54.2 – 60.6) than males (47.7%, 95% CI: 43.4 – 51.7) reported brushing their teeth after main meals. Comparing ethnic groups, more adults of 'Other Bumiputera' (66.5%, 95% CI: 61.3 – 71.3) reported brushing their teeth after main meals compared to major ethnic groups; Malays (54.7%, 95% CI: 50.5 – 58.8), Indian (50.0%, 95% CI: 38.8 – 61.1), and Chinese ethnicity (32.9%, 95% CI: 27.4 – 38.8). Comparing educational status, there seems to be significantly more adults with no formal education (69.5%, 95% CI: 57.8 – 79.2) who brushed their teeth after the main meals than adults with secondary education (51.1%, 95% CI: 47.1 – 55.2) and tertiary education (51.2%, 95% CI: 46.3 – 56.1). By employment status, significantly more government/semi-government employees (65.8%, 95% CI: 59.0 – 72.0) reported brushing their teeth after main meals compared to private sector employees (48.3%, 95% CI: 43.9 – 52.7) (**Table 4.13**). Of those who had brushed their teeth after the main meals, about 38.2% (95% CI: 34.8 – 41.8) had always brushed their teeth after main meals while 61.8% (95% CI: 58.2 - 65.2) had only sometimes brushed their teeth after their main meals. Significantly less males (31.7%, 95% CI: 27.1 – 36.7) reported that they had always brushed their teeth after main meals compared to females (44.2%, 95% CI: 39.6 – 48.8) (**Table 4.14**).

4.2 Implications

It is equally important to study how food/drinks are consumed in addition to what is consumed. Proper consumptions of food/drinks in relation to main meals can contribute to better health. A good oral hygiene habit in relation to main meals promotes good oral health.

Among those who had consumed water in relation to main meals, only about 1 in 5 adults had consumed plain water within 30 minutes before their meals. Drinking water contribute to a feeling of fullness so that less food is eaten and, over time, promote weight loss.¹ However, the findings showed that about 6 in 10 adults had consumed water after meals and about 2 in 10 during meals. This habit may actually be beneficial as it has been reported that drinking water during and after meals can aid the digestion of foods.²

Intake of fruits and vegetables decreases risks of major chronic diseases like heart disease. There is an increased uptake of nutrients into the body when fruits are taken on an empty stomach.^{3,4,5} Alternatively, fruits can be taken an hour to two after meals.^{3,5} Among those who had consumed fruits in relation to main meals, only about 1 in 5 had ate fruits within half an hour before their main meals but majority had ate fruits after meals.

Majority of adults (3 in 4) in this survey reported chewing their food less than twenty times before swallowing their food. Chewing food for a longer period before swallowing reduces obesity.^{6,7} There is evidence that the chewing food for as long as forty times reduces food

intake by 12% compared to a chewing of 15 times before food is swallowed.⁴

Among adults who reported consuming carbonated beverages, about 1 in 2 had not used a straw during their consumption. Carbonated drinks contain a high level of acid which can contribute to dental erosion.⁸ Long term erosion of this outer layer of teeth causes tooth sensitivity and may also result in dental caries.⁹ The use of straw can reduce the direct contact between teeth especially the anterior teeth and carbonated drinks.^{8,9}

Only 4 in 10 adults reported not rinsing their mouth after consuming sugary food. Mouth rinsing after food consumption removes food remnants which bacteria can feed on in the process of weakening the tooth surface.^{10,11,12} Rinsing can therefore help reduce the occurrence of dental caries. Besides this, it will also reduce the formation of dental plaque which causes periodontal disease.

Bacterial activity in the mouth is increased during sleep because of decreased salivary flow.¹³ It is recommended we brush at least twice a day; before breakfast and before sleep at night. Brushing before breakfast neutralizes the acidic pH of the oral cavity after a night's sleep.^{14,15} Almost all adults in this survey reported brushing their teeth before breakfast.

About 1 in 2 adults had brushed their teeth after main meals. Brushing of teeth immediately after the main meals can damage the tooth surface especially when the food consumed is acidic.¹⁶

4.3 Conclusion

The findings of this survey showed that only 1 in 5 adults consume plain water before main meals, only 1 in 5 adults take fruits before main meals, less than 1 in 20 adults chew their food longer than forty times before swallowing their food, only about half of the adults use a straw when drinking carbonated drinks, more than a third of adults don't rinse their mouth after sugary meals, majority brush their teeth before breakfast and slightly more than half of the adults brush their teeth after main meals.

In light of these findings, there is a need to promote healthy food consumption habits among adults in Malaysia in relation to fruit consumption, chewing of food, use of straw when consuming carbonated beverages, mouth rinsing after taking sugary food and tooth brushing after main meals.

4.4 Recommendations

From the findings of this survey, it is recommended that awareness of healthy food habits be further strengthened in health promotion messages towards better health, including oral health. There is a need to promote the following messages:

- Consumption of water and fruits about half an hour before meals
- Chewing food for a longer period (chewing more than twenty times) before swallowing
- Use of a straw when consuming carbonated beverages
- Mouth rinsing after taking sugary food to reduce the occurrence of dental caries and periodontal disease.
- Brushing of teeth be carried out only about thirty minutes after main meals.^{17,18}

Definition of variables: Habits in relation to food consumption (Cont.)

Variable Name	Variable in SPSS	Weight	Definition	SPSS Variable Definition
C303_proportion	C303_proportion	Final_weight	The proportion of respondent who know how long they chew their food before swallowing.	RECODE C303 (-7=0) (-6=-6) (1 thru 3=-1) INTO C303_proportion. EXECUTE. 0 = Don't know 1 = Yes -6 = Missing
C303	C303	Final_weight	Number of times food is chewed before swallowing	1 = Less than 20 times 2 = 20 – 40 times 3 = More than 40 times -9 = Refuse to answer -7 = Don't know
C304_proportion	C304_proportion	Final_weight	The proportion of respondent taking carbonated drinks.	RECODE C304 (-8=0) (-6=-6) (1 thru 3=-1) INTO C304_proportion. EXECUTE. 0 = Do not take carbonated drinks 1 = Yes, taking carbonated drinks -6 = Missing
C304	C304	Final_weight	Use a straw when drinking carbonated beverages	1 = Yes, always 2 = Yes, sometimes 3 = No -8 = Did not take carbonated beverages -9 = Refuse to answer
C305_proportion	C305_proportion	Final_weight	The proportion of respondent who rinse their mouth after taking sugary food.	RECODE C305 (3=0) (-6=-6) (-9=-6) (1 thru 2=1) INTO C305_pr oportion. EXECUTE. 0 = No, do not rinse the mouth 1 = Yes, rinse the mouth -6 = Missing

TOPIC 5

FOOD LABEL READING AND UNDERSTANDING

5. FOOD LABEL READING AND UNDERSTANDING

Contributors to this section: Rashidah Ambak, Leni Tupang, Mohd Hazrin Hasim, Natifah Che Salleh, Norlida Zulkafly.

5.1 Findings

5.1.1 Practise of Reading Food Label Every Time Buying or Receiving Food from Others

Overall, 23.0% (95% CI: 20.8 – 25.4) of adult respondents in Malaysia reported as ‘always reading’ food label when buying or receiving food from others. Another 22.0% (95% CI: 19.8 – 24.4) of respondent reported as ‘sometimes reading’ food label, while 55.0% (95% CI: 52.1 – 58.0) reported as ‘not reading’ food label (**Table 5.1**). By zone, respondents in Peninsular Malaysia, 23.9% (95% CI: 21.2 – 26.8) showed a slightly higher prevalence in ‘always reading’ food label compared to those living in East Malaysia, 19.7% (95% CI: 16.9 – 22.9). Those living in Peninsular Malaysia reported an almost similar prevalence 21.9% (95% CI: 19.2 – 24.8) of ‘sometimes reading’ food label compared to those in East Malaysia 22.7% (95% CI: 19.6 – 26.1) (**Table 5.1**). Prevalence of ‘not reading’ label was slightly higher among respondents living in East Malaysia 57.7% (95% CI: 53.7 – 61.5), compared to those in Peninsular Malaysia 54.3% (95% CI: 50.7 – 57.8) (**Table 5.1**). By strata, respondents living in the urban area 24.8% (95% CI: 21.9 – 28.0) reported ‘always reading’ food label, significantly higher than those living in the rural areas 18.8% (95% CI: 16.2 – 21.8) (**Table 5.1**). Both respondents living in the urban area, 22.3% (95% CI: 19.3 – 25.6) and rural area 21.4% (95% CI: 18.9 – 24.0) reported an almost similar prevalence of ‘sometimes reading’ food label. Prevalence of ‘not reading food’ label was higher among those living in the rural area 60.0% (95% CI: 56.2 – 63.3) compared to those in the urban area 52.9% (95% CI: 49.0 – 56.7) (**Table 5.1**).

5.1.2 Prevalence of Reading Nutrition Information in Food Label Every Time Buying or Receiving Food

Among those who read (‘always reading’ and ‘sometimes reading’) the nutrition label when buying or receiving food (45.0%, n=1299), the three most common types of nutritional information being read were carbohydrate (including sugar) 21.6% (95% CI: 19.44 – 24.0), fat 19.9% (95% CI: 17.9 – 22.1) and total energy 14.5% (95% CI: 12.9 - 16.2) (**Table 5.2a**). It was followed by vitamin 9.1% (95% CI: 7.8 – 10.6), salt/sodium 6.7% (95% CI: 5.6 - 7.9), food additive 6.2% (95% CI: 5.0 – 7.5), mineral content 5.6% (95% CI: 4.6 - 6.7) and fibre 3.3% (95% CI: 2.6 – 4.2) (**Table 5.2a & Table 5.2b**).

5.1.3 Pravalence of Understanding the Information in Nutrition Labels

Pertaining to understanding of the food label, the prevalence of respondents who responded as ‘always understand’ the information in food label every time when buying or receiving food was 48.7% (95% CI: 44.7-52.7), ‘sometimes understand’ the information was 40.8% (95% CI: 37.0-44.7) and ‘did not understand’ the information was 10.5% (95% CI: 8.5-12.9) (**Table 5.3**). By zone, the prevalence of respondents from Peninsular Malaysia who ‘always understand’ the information was slightly higher 49.5% (95% CI: 44.7-54.3) than the respondents from East Malaysia 45.5% (95% CI: 39.4-51.8). Whereas the prevalence of the respondents from East Malaysia was slightly higher in ‘sometimes understand’ the information 42.3% (95% CI: 36.3-48.6) and ‘did not understand’ the

information 12.2% (95% CI: 9.2-15.9) compared to respondents from Peninsular Malaysia 40.4% (95% CI: 35.9-45.0) and 10.1% (95% CI: 7.7-13.0) (**Table 5.3**). By strata, the prevalence of respondents who lived in the urban area who 'always understand' the information was significantly higher 51.7% (46.5-57.0) compared to the respondents in the rural area 40.6% (95% CI: 35.9-45.5). But the prevalence of the respondents in the rural area showed significantly higher in 'sometimes understand' the information 45.6% (95% CI: 41.0-50.2) and 'did not understand' the information 13.8% (95% CI: 10.8-17.4) compared to the respondents in the urban area 39.0% (95% CI: 34.1-44.1) and 9.3% (95% CI: 6.8-12.5), respectively (**Table 5.3**).

5.1.4 Practise of Reading Expiry Date Label Every Time Buying or Receiving Food

In general, the prevalence of respondents who stated that they 'always read' the expiry date in the survey was 82.2% (95% CI: 80.0 – 84.2) (**Table 5.4**). The prevalence was significantly higher in Peninsular Malaysia, 84.2% (95% CI: 81.5 – 86.5) compared to East Malaysia at 75.0% (95% CI: 71.1 – 78.5). The prevalence was also significantly higher among the respondents living in the urban area 84.6% (95% CI: 81.8 – 87.0) compared to their counterpart in the rural at 76.8% (95% CI: 72.9 – 80.3) (**Table 5.4**).

5.1.5 Practise of Reading Precautionary Label Every Time Buying or Receiving Food

The national prevalence of Malaysian adults who stated that they 'always read' the precautionary food label was high 44.7% (95% CI: 42.1 – 47.4), while 'sometimes read' the precautionary food label was 21.2% (95% CI: 19.0 – 23.4) and 'never read' the precautionary food label was 34.2 (95% CI: 31.6 – 36.9) (**Table 5.5**). By zone, the respondents from Peninsular Malaysia showed a higher prevalence 47.0% (95% CI: 43.9 – 50.2) of 'always read' the precautionary food label, as compared to the respondents from East Malaysia 36.3% (95% CI: 31.9 – 40.9). By strata, the urban respondents showed significantly higher prevalence in 'always read' the precautionary food label 48.2% (95% CI: 44.8 - 51.6) as compared to the rural counterpart 36.9% (95% CI: 33.1 – 40.9) (**Table 5.5**).

5.2 Implication

Overall, the Malaysian adult population showed a significant increase in the prevalence of 'not reading' food label (55.0%), compared to NHMS 2006 (19.3%).¹ Pertaining to strata, MANS 2014 reported a big decline in the prevalence of reading food label compared to NHMS 2006 (Urbanite respondents: 24.8% vs 57.2% and rural respondents 18.8% vs 49.8%).¹ Almost half of the Malaysian adult population reported as not reading the food label when buying or receiving food from others. Information on the food label was not used in choosing appropriate food and managing their health conditions. Unfamiliarity to the technical terms and negligence of certain nutrient information that they perceived as not important to their health also contributed to the low prevalence of reading food label.²

Pertaining to the types of label been read, expiry date was the most popular information been read by the adult population in Malaysia and other countries.^{3,4} They put less attention in reading carbohydrate, fat and total energy, which contributed to energy for the body. Further, only 7.0% and 3.0% of the respondents reported reading sodium content and fiber information, respectively. A study on the understanding of the Malaysian Dietary Guidelines (MDG)⁵ in 2010 showed that more than half of the respondents were not aware

on the health messages in the MDG. Unfamiliarity with the key messages in the MDG indicated that respondents were not aware of the basic nutrition information that had been disseminated by the Ministry of Health. In this situation, the respondents will not be able to examine the right nutrient information on the label and apply it to their own health condition. Thus, the food label was not fully used by the respondents in aiding them to choose appropriate healthy foods for their families and themselves. This situation was in contrast with the European consumers who looked in detail for calories, fat and sugar information before choosing packaged food.⁶

5.3 Conclusion

This study showed that only half of the Malaysian adult population reported reading the food label when buying or receiving food from others. Most of the respondents reported as understanding the food label. Types of labels read have not been prioritized to the macronutrients that contribute calories.

5.4 Recommendation

The information provides useful information for the policymaker and health authority to plan for the future nutrition information program in instilling awareness and planning obesity intervention programs among the relevant target groups. Hence awareness on the importance of reading labels can help in providing informed food choices and guiding in selecting appropriate foods related to their health condition. More nutrition research projects implementing an objective approach are needed to discover the actual readers and their level of understanding of the food label.

VITAMIN, MINERAL AND FOOD SUPPLEMENT INTAKE

6. VITAMIN, MINERAL AND FOOD SUPPLEMENT INTAKE

Contributors to this section: Nor Azian Mohd Zaki, Mohd Naim Rasidi, Helen Tee Guat Hiong, Hasimah Ismail, S Maria Awaluddin, Noor Safiza Mohamad Nor, Rahama Samad

6.1 Findings

The total number of respondents who took part in this survey was 3,000. The number of respondents who answered questions on vitamin and mineral supplements was 2991 (99.7%) and respondents who answered questions on food supplement were 2995 (99.8%).

6.1.1 Overall prevalence of vitamin and mineral supplement users

Vitamin and mineral (VM) supplements are defined as mineral, synthetic nutrients, and vitamins sold singly or in mixtures in controlled dosages form such as sachets, capsules, liquids, lozenges, powders or tablet. This includes multivitamin and multimineral, Vitamin A/Carotenoids, Vitamin B complex, Vitamin B12, Vitamin C, Folic Acid (B6), Iron, Calcium, Vitamin E and Zinc.

The national prevalence of VM supplement users was 28.05% (95% CI: 25.70- 30.50). The prevalence in Peninsular Malaysia was 28.57% (95% CI: 25.75-31.56) and 26.10% (95% CI: 22.78-29.71) in East Malaysia. The prevalence of VM supplement users was significantly high among the urban population at 30.93% (95% CI: 27.83-34.21) compared to rural at 21.51% (95% CI: 18.62-24.71). More women took VM supplements [32.12% (95% CI: 29.26-35.12)] compared to men [24.30% (95% CI: 21.24-27.65)]. Significantly, more urban men [27.42% (95% CI: 23.28-31.98)] used VM supplement compared to rural men [17.66% (95% CI: 14.07-21.93)]. This finding was also similar among female (**Table 6.1**).

6.1.2 Prevalence of most commonly taken vitamin and mineral supplement

In this survey, five most commonly taken VM supplements were Vitamin C [15.68% (95% CI: 13.92-17.61)] followed by Multivitamins [8.87% (95% CI: 7.49-10.47)], Calcium [5.84% (95% CI: 4.84-7.04)], Vitamin B complex [5.62% (95% CI: 4.70-6.71)] and Folic Acid [9.63% (95% CI: 7.17-12.82)] (**Table 6.2**).

Among who were VMS user, [55.92% (95% CI: 51.10-60.62)] took Vitamin C followed by Multivitamins [31.63% (95% CI: 27.56-33.99)], (**Table 6.3a**) Calcium [20.83% (95% CI: 17.56-24.53)], (**Table 6.3c**) Vitamin B complex [20.60% (95% CI: 17.45-23.31)] and Folic Acid [9.63% (95% CI: 7.17-12.82)] (**Table 6.3d**).

The users of Vitamin C were significantly higher among East Malaysia population at 71.06% (95% CI: 65.16- 76.32) than Peninsular Malaysia at 52.17% (95% CI: 46.46 - 57.82). The prevalence of vitamin C user among urban population was 54.54 (95% CI: 48.57-60.38) and 60.40% (95% CI: 54.29 -66.21) among rural population. Among those who took multivitamins, the prevalence was 33.10% (95% CI: 28.29-38.28) among population in Peninsular Malaysia and 25.69% (95%CI: 19.82-32.58) among population in East Malaysia. The prevalence of calcium users in Peninsular Malaysia was 21.98% (95%CI: 18.08-26.45) and 16.19% (95%CI: 11.99-21.52) in East Malaysia. The prevalence among urban population was 22.01% (95% CI: 18.00-26.62) and rural population was 17.00% (95% CI: 12.72-22.35). The prevalence of Vitamin B Complex users in Peninsular Malaysia were 19.15 (95% CI: 15.81-23.01) and East Malaysia were 13.71 (95% CI: 18.73-29.52). The users of Vitamin B Complex were significantly higher among rural population with the prevalence of 28.18% (95% CI: 23.03-33.98) compared to the urban population;

17.56% (95% CI: 14.20-21.52). Among those who took folic acid, the prevalence among the rural population was 13.19% (95% CI: 9.77-17.57) and 8.54% (95% CI: 5.67-12.68) among the urban population.

6.1.3 Frequency of vitamin and mineral supplement intake

Most of the users took VM supplements daily. The highest was the Folic Acid intake (75.10%) followed by the Zinc intake (75.09%), with the estimated population of 393,281 and 194,323. In addition, among the five commonly taken VM supplements, the intake frequency for these supplements daily was more than 50% (**Table 6.4**).

The proportion of a single user VM supplements was 61.97% (95% CI: 57.40-66.35) (**Table 6.5**), while the proportion of multiple users supplements were 38.03% (95% CI: 33.65-42.60). The proportion of multiple users among Peninsular Malaysia and East Malaysia was 37.53% (95% CI: 32.39-42.98) and 40.01% (95% CI: 33.23-47.20), respectively (**Table 6.6**).

The three main reasons for taking VM supplements among adults population were for health, followed by the doctor's prescription and to get extra energy.

6.1.4 Overall prevalence of Food Supplements Users

In this survey, food supplements (FS) are defined as non-vitamin and non-mineral supplement products with health claim that are made from natural food or food derivatives, for examples fish oil, essence of chicken, sea cucumber products and traditional herbs.

Traditional herbs are defined as natural remedies from herbs and food, which includes botanical or animal derived extracts (Traditional & Complementary Medicine, MOH 2011)

The national prevalence of FS users was 34.02 (95%CI: 31.37-36.77). The prevalence was higher in Peninsular Malaysia (35.85%; 95% CI: 32.66-39.17) compared to East Malaysia (27.24%; 95%CI: 23.41-31.44). The prevalence of 37.89% was significantly higher among urban population (95%CI: 34.34- 41.58) compared to rural [25.24 % (95% CI: 22.08-28.68)]. The FS intake among female was 38.37% (95% CI: 35.06- 41.78) and among male was 30.03(95% CI: 26.68- 33.60). The prevalence of FS users was high among urban women [42.66% (95% CI: 38.36- 47.07) compared to rural women [27.98% (95% CI: 23.96-32.39) (**Table 6.8**).

6.1.5 Prevalence of most commonly taken food supplement

The top five most commonly taken FS were fish oil (10.58%;95% CI: 9.08- 12.29), royal jelly [6.15% (95% CI: 4.88- 7.71)], spirulina [3.39 % CI: 2.67- 4.31)], collagen [2.92% CI: 2.26-3.77]) and traditional herbs [2.76% CI: 2.06-3.70] (**Table 6.9**).

Among who took supplements [26.24% (95% CI: 22.41-30.46)] took fish oil (**Table 6.10a**), [18.07% (95% CI: 14.67-22.06)] took royal jelly (**Table 6.10b**), [9.99% (95% CI: 7.88-12.59)] took spirulina (**Table 6.10c**), [8.60% (95% CI: 6.76-10.89)] took collagen (**Table 6.10d**), and [8.14% (95% CI: 6.12-10.75)] took traditional herbs (**Table 6.10e**).

The users of fish oil were higher among urban population at 29.28% (95% CI: 24.55-34.51) than rural population [15.88% (95% CI: 11.34-21.78)]. Among those who took the royal jelly, the prevalence among Peninsular Malaysia was 18.85% (95% CI: 14.91-23.53) and among East Malaysia was 14.30% (95% CI: 9.72-20.55).The prevalence of spirulina users among urban population was 8.60% (95% CI: 6.21-11.80) and rural population was 14.68% (95% CI: 10.97-19.39).The users of Collagen among Peninsular Malaysia population was 8.06%

(95% CI: 6.00-10.75) and East Malaysia was 11.22% (95% CI: 7.91-15.68). Among those who took the traditional herb, the prevalence among the urban population was 8.29% (95% CI: 5.87-11.57) and the user among the rural population was 7.62% (95% CI: 4.98-11.48).

6.1.6 Frequency of food supplement intake

The highest frequency of intake for the FS supplement was every day for Berry Essence (83.30%) with the estimated population at 110,388. Among the five commonly taken FS, the intake frequency for these supplements taken every day was more than 50% (**Table 6.11**).

The proportion of a single user for FS was 68.46% (95% CI: 64.39-72.27) (**Table 6.12**), while, the proportion of multiple users for FS was 31.54% (95% CI: 27.73-35.61) (**Table 6.13**). For a single user, 66.80% (95% CI: 61.85-71.41) were urban population and 74.13% (95% CI: 68.18-79.30) were rural population. For multiple users, 33.20% (95% CI: 28.59-38.15) were urban population and 25.87% (95% CI: 20.70-31.82) were rural population.

The main reasons for taking FS among adults population were health, followed by boosting their energy. Among those who took collagen, it was reported that the main reason of the consumption was for beauty (**Table 6.14**).

6.2 Implications

This is the second national survey conducted in Malaysia. In the first MANS (2003), the prevalence of vitamin and mineral supplements intake among the adult population was 23.94%, and the prevalence of non-vitamin and non-mineral was 24.79%. The prevalence of the present survey was higher than the previous survey (28.05% and 34.02%). There was an increase trend of both VM and FS intake between year 2003 and 2014. The prevalence of VM and FS supplements users were higher among adults living in urban areas. These findings were similar to the previous MANS 2003.

6.3 Conclusion

In conclusion, the results of the Malaysian Adults Nutrition Survey 2014 found that the prevalence of VM and FS users has increased tremendously from the earlier survey especially in urban population. The main reason for VM and FS intake was for health claim. Most of the users used supplements daily of a single type of VM or FS.

6.4 Recommendation

The increasing trend of VM and FS user in Malaysia needs further research to provide scientific evidence of each type of supplement especially FS. It is likely that most of the users took the FS based on the health claim of the particular product.

The related authorities should establish regulation, policy and guidelines on the usage and distribution of supplements in Malaysia. This is important in ensuring people to practise the recommended dietary habits and not to be influenced by the marketing strategy on health claim of the product.

Those who plan to take supplements should consult healthcare professionals regarding their health status, dietary practices and the need for certain supplements. Health care professionals should be aware of the scientific evidence of each product before giving advice on the use of supplements.

DEFINITION OF VARIABLES: VITAMIN AND MINERAL SUPPLEMENT

Variable Name	Variable in SPSS	Weight	Definition	SPSS Variable Definition
Vitamin/ mineral supplement	e1100	Final_weight	<p>Vitamin and mineral supplement (VM) supplements were defined as mineral, synthetic nutrients, and vitamins sold singly or in mixtures in controlled dosages form such as sachets , capsules, liquids, lozenges, powders or tablet</p> <p>This includes:</p> <ul style="list-style-type: none"> • Multivitamin and multimineral • Vitamin A/Carotenoids • Vitamin B complex • Vitamin B12 • Vitamin C • Folic Acid (B6) • Iron • Calcium • Vitamin E • Zinc • Others 	<p>Value labels e1100</p> <p>1 = Yes</p> <p>2 = No</p> <p>-7 = Don't know</p> <p>-9 = Refuse to answer</p>
Multivitamin and Multimineral, Vitamin A/ Carotenoids, B complex vitamin, Vitamin B12, Vitamin C, Folic Acid/B6, Iron, Calcium, Vitamin E, Zinc, Others	e1201 – e 1211	Final_weight	Type of vitamin/mineral taken	<p>Value labels e1201, e1202, e1203, e1204, e1205, e1206,e1207, e1208, e1209, e1210, e1211</p> <p>1 = Yes</p> <p>2 = No</p> <p>-9 = Refuse to answer</p>

TOPIC 7

PHYSICAL INACTIVITY

7. PHYSICAL INACTIVITY

Contributors to this section: Lim Kuang Kuay, Mohd Azahadi Omar, Siti Fatimah Mat Hussin, Hazizi Abu Saad & Joanita Sulaiman

7.1 Findings

The study indicated approximately 7.1 million Malaysian adults were physically inactive, which represented 36.9% [(CI: 34.5-39.3)] of the adult population aged 18 years to 59 years old. In other word, there were about 4 out of 10 adults who were physically inactive in this country (**Table 7.1**).

7.1.1 Prevalence of Physical Inactivity by Zone and Strata

Peninsular Malaysia had higher prevalence of physical inactivity [38.4% (CI: 35.5-41.3)], compared to East Malaysia [31.2% (CI: 27.5-35.1)]. Urban residents were found to be more physically inactive [37.9% (CI: 34.9-41.1)] compared to rural residents [34.4% (CI: 30.8-38.2)] (**Table 7.1**).

7.1.2 Prevalence of Physical Inactivity by Gender

Physical inactivity was more prevalent in females [50.0% (CI: 46.6-53.4)] compared to males [24.7% (CI: 22.3-27.2)] (**Table 7.1**).

7.1.3 Prevalence of Physical Inactivity by Age group

The highest physical inactivity was more prevalent in adult age 50-59 [40.1% (CI: 35.0-45.4)] and the lowest physical inactivity was adult age 40-49 [32.2% (CI: 28.2-36.5)] (**Table 7.1**).

7.1.4 Prevalence of Physical Inactivity by Ethnic group

The highest prevalence of physical inactivity was observed among Chinese [40.7% (CI: 35.1-46.4)] followed by Malays [38.5% (CI: 35.2-42.0)], Bumiputra Sarawak [35.6% (CI: 27.0-45.2)], Others [35.4%(CI: 24.4-48.1)], Indians [30.8% (CI: 23.9-38.7)] and Bumiptra Sabah [23.3%(CI: 18.3-29.0)] (**Table 7.1**).

7.1.5 Prevalence of Physical Inactivity by Marital Status

Divorcee showed the highest prevalence of physical inactivity [41.3% (CI: 30.7-52.8)], followed by married [36.8% (CI: 34.0-39.7)] and unmarried residents [35.9% (CI: 31.4-40.7)] (**Table 7.1**).

7.1.6 Prevalence of Physical Inactivity by Education Status

Residents with only primary school education had the highest prevalence of physical inactivity [38.5% (CI: 32.9-44.3)] followed by secondary [37.4% (CI: 34.1-40.7)], tertiary [35.4% (CI: 31.1-40.0)] and no formal education [34.1% (CI: 24.6-45.0)] (**Table 7.1**).

7.1.7 Prevalence of Physical Inactivity by Occupational Status

The highest prevalence of physical inactivity was among the unemployed residents [51.7% (CI: 46.0-57.3)] followed by private [34.8% (CI: 31.2-38.7)], government officials [33.4% (CI: 27.5-39.9)], and self-employed residents [32.8% (CI: 28.3-37.7)] (**Table 7.1**).

7.1.8 Prevalence of Physical Inactivity by Household Income

Residents with household income of more than RM3, 500/ month had the highest prevalence of physical inactivity [38.9% (CI: 34.3-43.7)], followed by those with income of less than RM1, 500 [36.6% (CI: 32.9-40.5)] and RM500-RM3, 500 [36.2% (CI: 32.1-40.4)] (**Table 7.1**).

7.1.9 Prevalence of Physical Inactivity by Domain

The prevalence of physical inactivity in each lifestyle domain was found to be higher compared to the overall prevalence of physical inactivity. The study found the prevalence of physical inactivity was highest in travelling [84.8% (CI: 82.7-86.)] (**Table 7.3**), followed by leisure time [70.0% (CI: 67.5-72.3)] (**Table 7.4**) and during working time [55.0% (CI: 52.1-57.9)] (**Table 7.2**).

7.2 Implication

The prevalence of physical inactivity in the study was comparable to NHMS 2011 (36.9% vs 35.7%).

7.3 Conclusions

The findings suggested four out of ten Malaysian adults were physically inactive. The overall prevalence of physical inactivity was 36.9% in estimated 19.27 million Malaysian adults aged between 18 and 59 years old. Overall, physical inactivity was highest among females, older age group and residents in the urban areas. Additionally, residents from Peninsular Malaysia had higher prevalence of physical inactivity than the East Malaysians. Inactive individuals are at higher risk of developing chronic diseases co-morbidities. It is thus important to target in a public health perspective. Decreasing physical inactivity in domains of everyday life, such as active commuting could increase mobility and long term healthy lifestyle.

7.4 Recommendations

National policies and programmes should integrate strategies and activities to promote physical activities. This includes the improvement of public transportation in an effort to promote walking. Furthermore, upsurge venue (cycling, walking, sports and exercise campaigns) as well as facilities to promote physical activity should be enhanced. Schools, government agencies, private organizations, NGOs and political organizations should be advocated to organize and participate in active lifestyle projects besides supporting them in organizing appropriate activity/ campaign / project related to physical activities. Break in sedentary activities should be encouraged among Malaysian adults to boost active lifestyle.

Further studies utilizing the objective methods of physical activity assessment for a sub sample of the population should be carried out.

Definition of variables: Physical Inactivity

Variable Name	Variable in SPSS	Weight	Definition	SPSS Variable Definition
Physical Inactivity	PA	Weight	1. Inactive (Low) 2. Active (Moderate and High)	<pre> *****active work vigorous***** COMPUTE vigorous_actv_work_mins=(f105_j * 60) + f105_m. EXECUTE. COMPUTE vigorous_actv_work_week=f104_h * vigorous_actv_work_mins. EXECUTE. RECODE vigorous_actv_work_week (MISSING=SYSMIS) (75 thru Highest=1) (Lowest thru 74.9=2) INTO vig_actv_work_week. EXECUTE. FOOD CONSUMPTION PATTERNS

8. FOOD CONSUMPTION PATTERNS

Contributors to this section: Mohamad Hasnan Ahmad, Ahmad Ali Zainuddin, Foo Leng Huat, Khoo Yi Yi, Yussof Sabtu, Anida @ Azhana Husna Zainudeen, Nur Hidayah Jamaluddin

8.1 Findings

A habitual food choice is an important factor in determining the common dietary habit practices of an individual. An understanding of common types of food consumed is crucial to identify the population's food choices. **Tables 1 to 7** show the most common types of foods and drinks, expressed as the top ten food items consumed on a daily or weekly basis among adult men and women aged 18 to 59 years from the National Malaysia Nutrition Adult Survey 2014.

Table 8.1 shows the mean frequency and prevalence of the top ten daily food items consumed among Malaysian adults. White rice was the most frequently consumed food by adults (89.8%) with a frequency intake of 1.86 times/day at an average of 2.48 cups/day. This was followed by sugar (55.9%), leafy green vegetables (43.2%), marine fish (29.4%), chillies (24.2%), condensed milk/ creamer (23.5%), soy sauce (20.3%), condiment (14.6%), hen egg (14.2%) and cream crackers (12.9%). This suggests the role of white rice as a major staple food among Malaysian population. When comparing between men and women, there was a similar pattern of daily food consumption as presented in **Tables 8.2** and **Table 8.3**, with the exception of hen egg and chicken consumed by men and cream crackers and anchovy consumed by women respectively. Men consumed more white rice than women (2.86 cups/ day vs. 2.05 cups/day).

There were also slight differences observed in the top ten weekly consumed foods among Malaysian adults (**Tables 8.4 to Table 8.6**), whereby hen eggs (70.6%) was the leading food consumed on a weekly basis with the consumption frequency of 2.70 ± 0.04 at 3.11 pieces each time, followed by chicken (66.9%), marine fish (56.4%), cabbage (55.7%), local cakes (53.9%), white bread (50.9%), other types of legumes (long bean, French bean and kacang botol) (47.6%), leafy green vegetables (47.3%) noodles (46.7%) and soy sauces (44.7%). There were many similarities found among the top ten weekly consumed foods between genders, with the exception where noodles and flavoured rice were favoured by men; soy sauce and mihun/ kuey teow/ laksa/ laksam/ loh shi fun were favoured by women respectively. Comparison of most common foods consumed by Malaysian adults both daily and weekly showed that marine fish, soy sauce and leafy green vegetables were the main food items consumed in their diet. There was an almost similar consumption prevalence of leafy green vegetables among adults whether daily or weekly, but the consumption prevalence of marine fish and soy sauce was twice higher in adults in a week as compared with their daily consumption.

Table 8.7 showed that plain water was the most consumed daily beverage item among majority of Malaysian adults (98.2%). This suggests an increasing awareness in the adult population on the health benefits of consuming plain water. The daily consumption of plain water was 7 times/day at 11 cups/day, followed by tea (0.7 times/day), and coffee (0.5 times/ day). Other beverages such as malted drinks, pre-mixed drinks, carbonated drinks, soy milk, commercial milk, fruit juices and cordial syrup were found to be consumed from ranges between 0.11 to 0.32 times/day, whereas energy drinks, fresh milk, herbal/ botanical drinks (brewed, pre-mixed, ready-to-drink) and chocolate drinks were among the least consumed beverages among these adults.

8.2 Implications

Based on the results from MANS 2014, it clearly shows that both daily and weekly food consumption patterns were diverse. The most commonly consumed foods were derived from legumes, meat and seafood, vegetables, eggs and sugar-based foods. White rice was considered a staple food of the Malaysian population as evidenced by a mean frequency consumption of about twice/ day. On the contrary, the consumption of sugar and sugar based foods contributed to at least 4 food items in a day (≈ 6.5 times/ day). Malaysian adults consumed marine fish, soy sauce and leafy green vegetables both daily and weekly in their diet. Adult Malaysians had a satisfactory habit of drinking plain water. It showed that on average they consumed at least 11 glasses of plain water daily, which was above the recommended intake of between 6 and 8 glasses per day.

8.3 Conclusions

White rice and hen eggs was a major contributor to the most common daily and weekly food items consumed respectively. Other food groups include vegetables, meat and seafood. There was an almost consistent food consumption pattern found between men and women in both top ten daily and weekly consumed foods. However, there was an increasing popularity of sugar and sugar-based food consumption among adults, as indicated by the four food items as the most daily consumed food. Hence, programmes need to be created and implemented to increase understanding regarding the harmful effects of sugar in relation to impacts on health such as diabetes, obesity and liver disease,

8.4 Recommendations

The identification of simple yet effective nutrition strategies need to be identified and implemented. The Ministry of Health should increase and reinforce its efforts in creating awareness and improving nutrition knowledge to encourage a change in nutrition behaviour.

TOPIC 9

NUTRITIONAL STATUS

9. NUTRITIONAL STATUS

Contributors to this section: Azli Baharudin, Ahmad Ali Zainuddin, Chan Ying Ying, Fauziah Nordin, Kee Chee Cheong, Mohd Ismail Noor

9.1 Findings

Based on the WHO (1998) classification, the national prevalence of underweight or chronic energy deficiency (CED) among Malaysian adults was 6.2% (95% CI: 5.1-7.6) (**Table 9.15**), while that of normal BMI was 42.9% (95% CI: 40.5-45.3) (**Table 9.8**). The prevalence of overweight and obesity was 32.4% (95% CI: 30.3 - 34.6) (**Table 9.13**) and 18.5% (95% CI: 16.6-20.5) (**Table 9.12**) respectively.

The prevalence of underweight/CED in Peninsular Malaysia [6.3% (95% CI: 4.9-8.0)] was comparable to East Malaysia [6.2% (95% CI: 4.6-8.2)]. There was no significant difference in prevalence of underweight between the urban [6.4% (95% CI: 4.9 – 8.3)] and rural areas [6.0% (95% CI: 4.7-7.6)]. The prevalence of underweight/CED was higher in men [7.7% (95% CI: 5.9-10.0)] compared to women [4.6% (95% CI: 3.5-6.1)], but it was not statistically significant. With the exception of age groups 40-49 [1.9% (95% CI: 1.1-3.2)] and 50-59 years [2.8% (95% CI: 1.4-5.4)], the prevalence of underweight/CED was significantly higher in age group of 18-19 years [24.0% (95% CI: 14.9-36.4)], followed by 20-29 years [10.1% (95% CI: 7.4-13.7)] and 30-39 years [4.6% (95% CI: 3.0-6.8)]. Malays reported a higher prevalence of underweight/CED [6.8% (95% CI: 5.2-9.0)] compared to Chinese [5.6% (95% CI: 3.5-8.7)], but it was not statistically significant.

The prevalence of normal BMI was higher in East Malaysia [46.6% (95% CI: 43.2-50.0)] compared to Peninsular Malaysia [41.9% (95% CI: 39.0-44.8)], but the difference was not statistically significant. A slightly higher prevalence of normal BMI was observed in rural areas [44.3% (95% CI: 41.0-47.6)] compared to urban areas [42.3% (95% CI: 39.2-45.4)], but it was not statistically significant. Men [44.5% (95% CI: 41.2-47.9)] had a higher prevalence of normal BMI than women [41.1% (95% CI: 38.0-44.1)], but the difference was not statistically significant. Among age groups, the highest prevalence of normal BMI was observed in the younger age group of 18-19 years [53.0% (95% CI: 40.8-64.8)], followed by 20-29 years [49.8% (95% CI: 44.8-54.8)], 30-39 years [41.5% (95% CI: 36.7-46.5)], 40-49 years [39.8% (95% CI: 35.3-44.6)], and 50-59 years [35.3% (95% CI: 30.5-40.5)].

Our findings showed that the prevalence of overweight between Peninsular Malaysia [32.4% (95% CI: 29.9-35.1)] and East Malaysia [32.4% (95% CI: 29.9-35.6)] was similar; with no significant differences observed between urban [32.7% (95% CI: 29.9-35.6)] and rural areas [31.8% (95% CI: 29.2-34.5)]; men [33.3% (95% CI: 30.2-36.6)] and women [31.4% (95% CI: 28.5-34.4)]. The prevalence of overweight increased significantly from 22.3% (95% CI: 18.6-26.5) in younger age group of 20-29 years to 32.7% (95% CI: 28.6-37.1) in 30-39 years, 39.3% (95% CI: 35.0-43.8) in 40-49 years, and 43.5% (95% CI: 38.0-49.1) in 50-59 years.

Although the prevalence of obesity was higher in Peninsular Malaysia [19.5% (95% CI: 17.2-22.0)] than East Malaysia [14.9% (95% CI: 12.8-17.3)], the difference was not statistically significant. It is interesting to note that there was no significant difference in obesity prevalence between urban [18.7% (95% CI: 16.2-21.5)] and rural areas [17.9% (95% CI: 16.0-20.0)]. The prevalence of obesity was significantly higher in women [22.9% (95% CI: 20.4-25.7)] compared to men [14.5% (95% CI: 12.0-17.0)]. The highest

prevalence of obesity was observed in adults aged 30-39 years [21.2% (95% CI: 17.7-25.2)], followed by 40-49 years [19.0% (95% CI: 15.6-22.9)], 50-59 years [18.4% (95% CI: 14.6-23.1)] and 20-29 years [17.8% (95% CI: 14.4-21.9)]. Comparison among the ethnic groups showed that Indians had the highest prevalence of obesity [28.1% (95% CI: 20.1-37.7)], followed by Malays [22.0% (95% CI: 19.4-24.8)], Bumiputera Sarawak [17.0% (95% CI: 12.5-22.7)], Bumiputera Sabah [14.1 (95% CI: 10.9-18.1)], and Chinese [10.8% (95% CI: 7.6-15.1)]. The differences in obesity prevalence were statistically significant between the Indians and Chinese, and between the Indians and Bumiputera Sabah.

The prevalence of obesity was highest among divorced/separated [21.2% (95% CI: 14.1-30.7)] followed by married/cohabiting [20.5% (95% CI: 18.4-22.8)] and never married [13.6% (95% CI: 10.6-17.3)]. The differences in obesity prevalence among married and never married was statistically significant. Based on educational levels, the tertiary level group had the highest prevalence of obesity [20.2% (95% CI: 16.7-24.3)], followed by secondary level [18.2% (95% CI: 15.70-21.0)] and primary level [17.3% (95% CI: 13.6-21.7)]. As for work status, non-employed group had the highest prevalence of obesity [28.5% (95% CI: 23.7-33.8)] followed by government/ semi-government employees [24.7% (95% CI: 19.1-31.3)], self-employed [17.4% (95% CI: 14.5-20.8)] and private sector [15.1% (95% CI: 12.5-18.1)].

Abdominal obesity is defined based on the WHO (1998) classification, with internationally accepted waist circumference (WC) cut-off points >102cm for men and >88cm for women. The national prevalence of abdominal obesity was 20.0% (95% CI: 18.1 - 22.1) (**Table 9.16**). The prevalence of abdominal obesity was higher in the East Malaysia [22.1% (95% CI: 19.6-24.8)] compared to Peninsular Malaysia [19.5% (95% CI: 17.1 - 22.1)] but it was not statistically significant. Abdominal obesity prevalence was slightly higher in the urban areas [20.4% (95% CI: 17.8 - 23.3)] as compared to the rural areas [19.3% (95% CI: 17.1 - 21.6)] but this difference was not statistically significant. Women showed a significantly higher prevalence of abdominal obesity [31.8% (95% CI: 28.7 - 35.0)] than men [9.6% (95% CI: 7.6 - 12.0)]. The prevalence of abdominal obesity increased with age peaking at 50 to 59 years. Approximately 50% the adults between 40-59 years had abdominal obesity. Among the three major ethnic groups, the abdominal obesity prevalence was significantly higher among the Indians [34.6% (95% CI: 27.4 - 42.7)] than the Malays [20.7% (95% CI: 18.2 - 23.7)] and Chinese [12.4% (95% CI: 9.1 - 16.6)].

9.2 Implications

Based on the WHO (1998) classification, the national prevalence of overweight has increased gradually from 26.7% in MANS 2003, 29.0% in NHMS 2006, 28.9% in NHMS 2011 to 32.4% in MANS 2014 (Figure 1). On the other hand, the prevalence of obesity had increased substantially from 12.2% in MANS 2003 to 14.5% in NHMS 2006, 15.4% in NHMS 2011 and 18.5% in the current MANS 2014 (Figure 2). Waist circumference was not measured in MANS 2003. But the prevalence of abdominal obesity (20.0%) in MANS 2014 is higher compared to NHMS 2006 (16.8%) and NHMS 2011 (18.6%) (Figure 3). General obesity and abdominal obesity are major contributors to various chronic diseases including type 2 diabetes mellitus, hypertension, coronary heart disease and certain types of cancers. Excessive accumulation of body fat is known to increase the risk of premature mortality and contributed to poorer quality of life. The increasing trend of obesity in the Malaysian population has imposed substantial burden on medical costs for treatment of many obesity-related diseases. Additionally, the higher proportion of obese population has lower productivity than their normal BMI counterparts.

Figure 1. Prevalence of overweight* (95% confidence interval) among Malaysian adults aged 18--59 years by sex

* Overweight (BMI: 25 to <30 kg/m²)

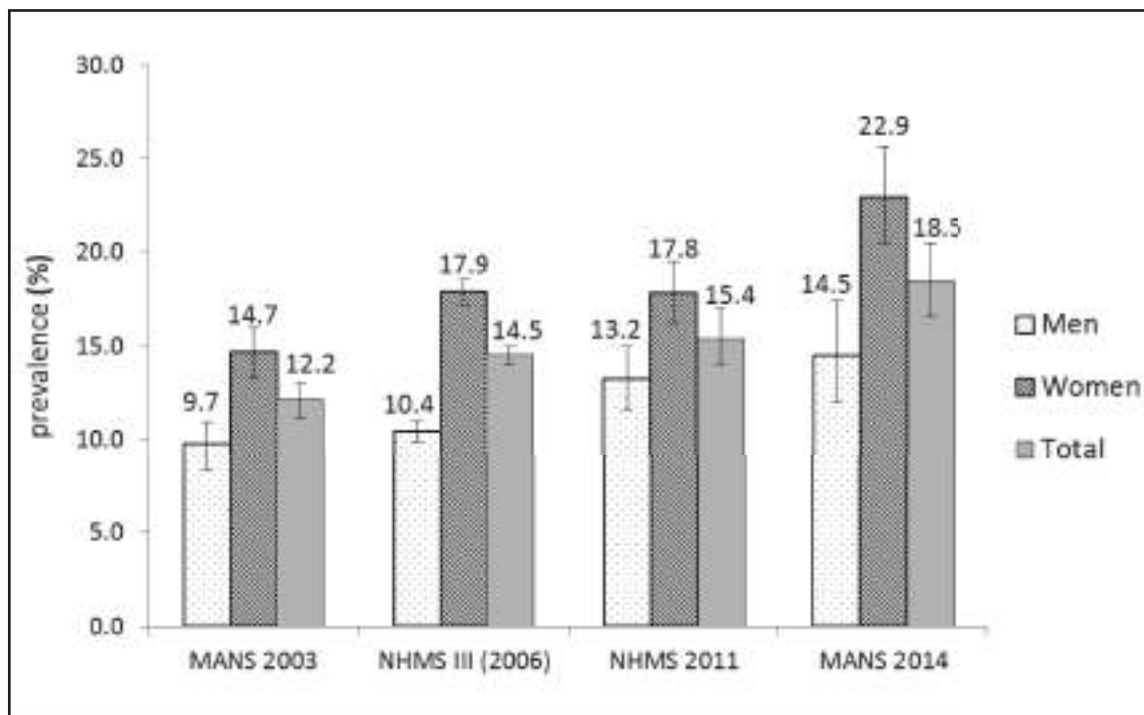

Figure 2. Prevalence of obesity* (95% confidence interval) among Malaysian adults aged 18-59 years by sex

* Obesity (BMI: ≥ 30 kg/m²)

Figure 3. Prevalence of abdominal obesity* (95% confidence interval) among Malaysian adults aged 18--59 years by sex

* abdominal obesity (WC WHO 1998 : Men 102cm/ Women 88cm)

9.3 Conclusion

The prevalence of obesity was notably higher among women, age 30-39 years old, Indians, and those with a higher educational level and income. There was an increasing trend in prevalence of overweight and obesity between the years 2003 and 2014. Abdominal obesity was more prevalent among women, older age group, Indians and those with lower educational level.

9.4 Recommendations

Obesity is a multifactorial adverse health condition resulting from the interactions of lifestyle, genetic and environmental factors. The prevention, management and successful treatment of obesity require a multidisciplinary approach, including dietary modification, nutrition education, behaviour modification, and exercise. Although reduced calorie intake and increased physical activity remain the main strategies to combat the problem of obesity, these strategies may not be to prevent obesity at the population level. A collaborative and concerted effort among the health professionals, local authorities, food industries, professional organizations, NGOs and the communities is urgently needed to prevent the rising trend in obesity. Recommended strategies for obesity prevention include the following:

1. Limiting unhealthy food (high in simple sugar and saturated fat) and increasing the consumption of fruits and vegetables in a daily diet.
2. Promoting physical activity by building more public sports facilities. Improving the environment to encourage a physically active lifestyle, such as providing more gated walking paths, bicycle lanes and improving access to public transportation.
3. Government policies to support the strategies for obesity prevention
 - a. Providing financial incentives for food manufacturers to produce food products with low sugar and fat content
 - b. Sales tax exemption on purchase of sports equipment
 - c. Providing incentives for local farms to increase production of fresh fruits and vegetables and facilitate its distribution to consumers at affordable prices
 - d. Restrict accessibility of less healthy foods and sugary beverages through limiting the number of fast food outlets in public venues (public transport stations, vicinity of higher learning institutions) and reduce their operating hours
 - e. Limiting the advertisements of less healthy foods and beverages in mass media
4. Empowering the individuals and communities by providing knowledge and skills to maintain ideal body weight and to facilitate weight loss (goal setting, monitoring of calorie intake and physical activity).
5. Childhood obesity is a predictor for adult obesity. Increasing awareness of weight related diseases and providing nutritional education in early age of life are important measures to reduce the risk of obesity in adulthood.

Definition of Variables : Nutritional Status

Variable Name	Variable in SPSS	Weight	Definition	SPSS Variable Definition

10.1 Findings

Information on dietary intake was collected using 24-hour diet recall, a widely used method to obtain quantitative dietary information of individuals in large epidemiological studies. This survey was undertaken to determine the population dietary practices and adequacy. A total of 2,973 respondents took part in this survey, of which 1,378 were men and 1,595 were women.

The daily median energy intake of Malaysia adults was 1466 kcal/day (Table 10.1) or 64% (Table 10.1) of the Recommended Nutrient Intake (RNI). The respondents in East Malaysia zones had higher energy intake and RNI achievement (66%) compared to Peninsular Malaysia counterparts (63%). Urban respondents had higher energy intake and RNI achievement (66%) than their rural counterparts (62%). The energy intake was lower among the older age group compared to the younger age group. In most of socio demographic group, women had lower median energy intake and per cent achievement of RNI than men.

The median daily intake of carbohydrate, protein and fat were about 195g (Table 10.2), 57g (Table 10.3) and 46g (Table 10.4) respectively. The median percentage of total energy contributed by macronutrient was 55% for carbohydrate, 16% protein and 29% fat (Figure 4). Contribution of energy by macronutrients was similar in both men and women.

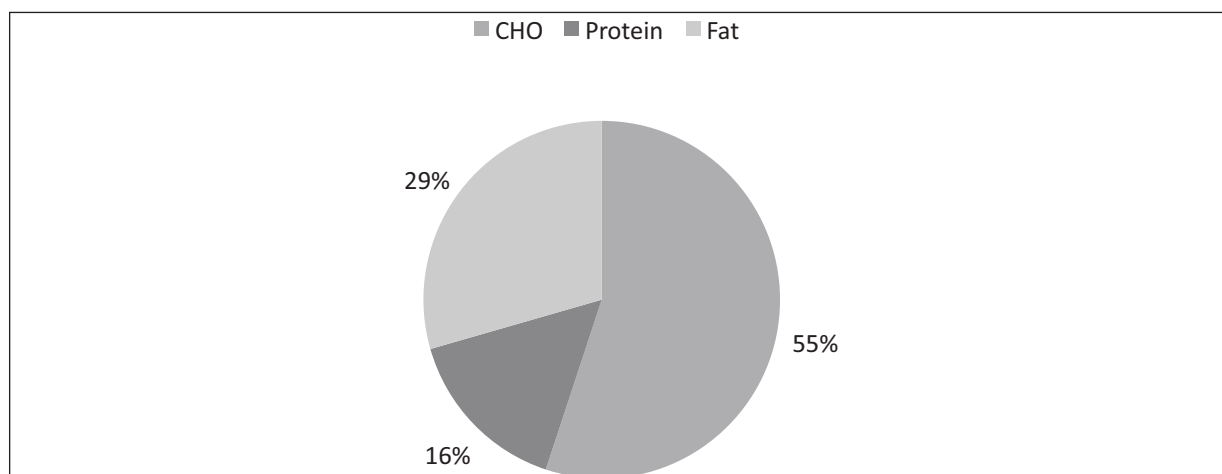

Figure 4: Median percentage of energy from macronutrients for total adult population.

Adults should consume less than 2,000 mg of sodium, or 5 grams of salt, and at least 3,510 mg of potassium per day, according to new guidelines issued by the WHO. The median sodium intake among Malaysian adults was about 1935 mg/day. Malaysian men had a median intake, which was higher than overall median by about 278 mg and by about 490 mg more than in women (Table 10.5). The respondents in East Malaysia (2026 mg) had higher sodium intake compared to Peninsular Malaysia (1865 mg). Urban respondents had higher sodium intake (2063 mg) than their rural counterparts (1763 mg). By age group, sodium intake range from highest in the 30 to 39 years group (2020 mg) to the lowest in 50 to 59 years group (1685 mg). In most of socio-demographic group, men had consumed more than recommended level of sodium intake than women.

The median intake for calcium was 357 mg/day (**Tables 10.6**) or 43% (**Table 10.13**) of the RNI. For all socio-demographic groups, the achievement of recommended level for calcium did not exceed 50%. The median intake of iron (**Table 10.7**) was about 9.9 mg/day with men (10.8 mg/day) having higher intake than women (9.0 mg/day). While men achieved more than 100% of RNI for iron, women satisfied only 52% of the recommended level with the exception of the oldest group (**Table 10.14**).

The median intake of vitamin C was about 39 mg/day (**Tables 10.8**) or 56% of the RNI recommended level (**Tables 10.15**). The respondents in East Malaysia zones had higher Vitamin C intake and RNI achievement (74%) compared to Peninsular Malaysia counterparts (46%). The median intake of vitamin A was about 480 µg/day (**Tables 10.9**) or 88% (**Tables 10.16**) of the recommended intake for vitamin A. The median intake of thiamine was about 0.59 mg/day (**Tables 10.10**) or 51% (**Tables 10.17**) of the recommended intake for thiamine. Men and women had similar achievements of RNI across zone and strata.

10.2 Implications

The present survey provides the second national estimates of the intake of energy and nutrients for the Malaysian population after being conducted for the first time in 2003.

10.3 Conclusions

The survey found that the intake of energy among Malaysian population fall short of the recommended intakes and lower than previous survey. While, intakes of other are well within the recommendations for a healthy diet. The intakes of major micronutrients studied were less than two thirds of the RNI. Calcium and iron were found to be the most inadequate particularly among women across socio-demographic group. As nearly half of the studied population had under-reported their energy intake, cautious interpretations of the current findings are needed.

10.4 Recommendations

Regular nutrition surveys should be carried out to provide valueable information on trends in food and nutrient intake, particularly among age and ethnically diverse subgroups of the population. Future studies are needed to explore the associations between diet and chronic diseases among Malaysians and finally, continued nutrition monitoring is needed to assess public adherence to dietary recommendations.
